

Tongchuan 10,000t/d Clinker Cement **Production Line Project**

Recently, the rotary kiln and preheater installation of the Tongchuan 10,000t/d clinker cement production line project (the “Project”) of West China Cement Limited (“WCC”) was successfully closed and topped, respectively. The construction of the Project achieved phased success. The vice presidents of WCC, Ms. Wang Rui and Mr. Wang Fayin, as well as other management visited the site to witness the construction.

Since the beginning of the Project, all management and staff have closely focused on the goal of ignition and production commissioning. Under the premise of ensuring epidemic prevention and control as well as safe

operation, they have strived to achieve high levels of construction efficiencies and qualities through formulating detailed promotion plans and emergency plans, rationally adjusting the installation project nodes as well as speeding up the working progress of various tasks actively, i.e. funding, equipment and logistics. The Project has made a new breakthrough, which indicates that the construction of the entire Project has reached a new starting point. In the later stage, all the Project staff will be full of energy and enthusiasm to ensure full production capacities and efficiencies, and at the same time, they will make every effort to construct the 10,000-ton line into a world-leading high-end intelligent and green production line at the super-class level in the industry.
